

Quick and Cost Effective Application Testing for Windows & Application Virtualisation

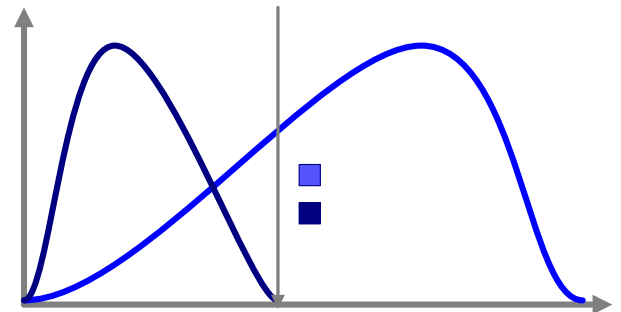

Planning your desktop strategy?

Most organisations have decided to postpone or completely avoid the move to Windows Vista and have chosen to wait until Windows 7 is released. Remaining on Windows XP is becoming less of an option due to support restrictions from Microsoft. Moving to Windows 7, however still involves resolving the same application challenges (and some more) as would be experienced in moving to Vista.

New technologies around application virtualisation can provide even more challenges as applications will need to both be able to work in a virtualised environment and also work on the target operating system.

Knowledge is power.....

To help define your desktop strategy, you need to understand if your applications will work under your proposed new environment. Powercube can automatically test all of your applications for compatibility with Microsoft Vista, Windows 7, APP-V and also Citrix XenApp and XenDesktop. This can be done in a fraction of the time and cost that a traditional manual testing programme would take – enabling you to make an informed choice as to the best fit environment for your applications.

Move into the migration fast-lane !

We will provide you with a Red/Amber/Green report, backed up by the detailed analysis against each application. But what next? With our experienced packaging engineers and sophisticated tools from ChangeBASE, Powercube will be able to remediate most of your applications – enabling them to work as expected on your chosen platform.
